Summary

Second-year Computer Science student at Symbiosis Institute of Technology with hands-on experience in software development, system design, and problem-solving. Actively builds practical skills through personal projects and hackathons, applying core programming concepts to real-world challenges. Eager to explore diverse domains within computer science, collaborate with like-minded peers, and contribute to innovative, tech-driven environments.

Skills

Frontend: React, TypeScript, Vite, CSS, Tailwind CSS

Backend: Node.js, Flask, C#, Express.js, Java

Tools & DevOps: Git, GitHub, Vercel, Postman, Figma, Canva, VS Code, Notion

Databases: PostgreSQL, MongoDB, MySQL, Supabase

AI Engineering: Python, PyTorch, Numpy, Pandas, Matplotlib, Scikit-learn

Other Skills: Quantum Computation, Blockchain, Linux, System Design, Open-Source

Experience

Kytes

June 2026 – Present

AI Engineer Intern

Internship

- Architected and deployed an autonomous AI agent engineered to streamline complex workflows and enhance data-driven decision-making processes.
- Integrated Large Language Models (LLMs) and specialized prompt frameworks, optimizing the agent's contextual understanding and response accuracy.
- Collaborated with the engineering team to design robust backend pipelines, ensuring seamless model deployment, low-latency API communication, and scalable performance.

Google

May 2026 – Present

Student Ambassador

Internship

- Represented Google Gemini on campus by promoting Google products, tools, and developer programs to the student community at SIT.
- Campus representative for Google Gemini, driving awareness of developer tools, programs, and initiatives among students.
- Promoted Google developer ecosystem on campus, organizing events and engaging the student tech community.

Projects

Image Processing Brain MRI | *Python*

January 2026 – April 2026

- **Developed an AI-assisted Brain MRI analysis system** to detect abnormal neurological patterns using 3D NIfTI MRI data.
- Designed a preprocessing pipeline to convert volumetric MRI scans into model-ready slices with normalization and modality-specific handling (FLAIR).
- Implemented segmentation-based labeling for tumor detection (BRATS) and integrated healthy control data (OASIS) to enable true abnormal vs normal classification.
- Integrated explainable AI using Grad-CAM to highlight critical brain regions influencing model predictions, improving clinical interpretability.

Awards & Certifications

- **Hashgraph Developer – The Hashgraph Association (2025):** Blockchain bootcamp conducted by the Hashgraph and Hedera Association.
- **Python – HackerRank (2025):** Certified Python knowledge by HackerRank.
